

Welcome to
seven-star luxury.

Climate by Alfa Laval.

The smallest room is a 1830 square feet suite with 14 phones, a pool table and a butler.

Nailed to its own artificial mini-island, the spectacular Burj Al Arab in Dubai, is arguably the most luxurious hotel on the planet.

A stunning atrium, 180 meters high, poses some rather special cooling challenges. With outside temperatures reaching 122°F, the formation of an indoor condensation cloud is a real possibility. Advanced engineering skills and well-tuned plate heat exchangers from Alfa Laval help keep the lobby fog-free and the climate equally comfortable from top to bottom.

In the scorching desert heat, that's luxury, too.
