

Hot stuff in a small package

AquaMicro is an extremely compact, ready-to-use district heating substation for domestic supply of hot tap water. It is tailored specifically to meet Danish needs – i.e. for the conditions prevailing in rather small district heating circuits.

AquaMicro was developed by the world leader Alfa Laval and represents an innovative approach to tap water heating in private homes. An integrated sensor (=constant tap water temperature) is one example of this.

A competitive price adds to the comfort!
