

## It takes surprising skills to make successful pills.

QPharma manufactures pharmaceuticals for other pharmaceutical companies.

You'd think that's a fairly straightforward occupation. That all it takes is advanced machinery and a clean factory environment.

Not so.

For sure, making drugs on a commercial scale requires an efficient, reliable, high-quality manufacturing plant. But at QPharma, we're taking a much more holistic approach.

By also taking on the development phase, we can save considerable time for

our customers. For example by optimizing the production line early on – while the drug is still in the lab.

This means our staff regularly gets involved in things like formulation, pre-clinical analysis, stability studies and pilot plant testing.

They also need to master the arts of project management, logistics and quality assurance. Not to mention packaging – from small volumes of plastic jars to millions of tablets blister-packed.

Though pills and other solid dosage forms are QPharma's main business, we

also have significant experience in other areas – including liquids and vaginal-ring hormone formulations.

When you come to us with your next project, you'll find skills here that may surprise you.

But we do think you might appreciate them nevertheless.
